Automated Application Lifecycle Management

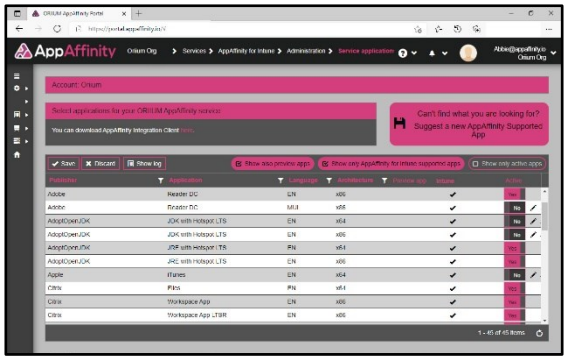
Stay ahead of the latest vulnerabilities within your third-party applications using AppAffinity

The application layer is the hardest to defend. Software without the most recent update is like an unlocked door for threat actors. They know the openings are there and can just walk in.

In 2021, Four in ten businesses reported being a victim of a security breach, this is why one of the UK Government's Cyber Security recommendations is that you should always apply the latest software updates, within 14 days of an update being published.

Automated

AppAffinity helps businesses to mitigate security threats by monitoring for new updates and automatically publishing them to endpoint devices, via your organisation's Microsoft Intune or Endpoint Configuration Manager Solution.



All updated applications are fully packaged into Intune or Endpoint Configuration Manager compatible formats, with all deployment settings fully configurable by the organisation.

Integrated

Setting up and using AppAffinity couldn't be easier. Simply link to your existing Intune or Endpoint Configuration Manager service and new application updates are automatically published via the online portal directly into your deployment solution as soon as they are available.

Time Saver

Once you've setup AppAffinity, that's it, no more checking of vendor update pages or creating install and uninstall scripts for deployment, it really is that simple.

AppAffinity Features:

- **Compliance -** Quickly address vulnerabilities in out-dated applications
- **Automated -** Pre-define schedules, device and deployment settings
- **Time saver** - Free up internal resource needed to manage updates
- **Cloud Based -** No requirement for on-premise infrastructure
- **Native Integration –** Use Microsoft Intune or Endpoint Configuration Manager for deployment
